Multiview & view

```
protected void page_load ( object sender,
                        EventArgs e )
```

```
{
```

```
    if ( ! IsPostBack )
```

```
        Multiview.ActiveViewIndex = 0 ;
```

```
}
```

```
protected void Button1_click ( object sender,
                        EventArgs e )
```

```
{
```

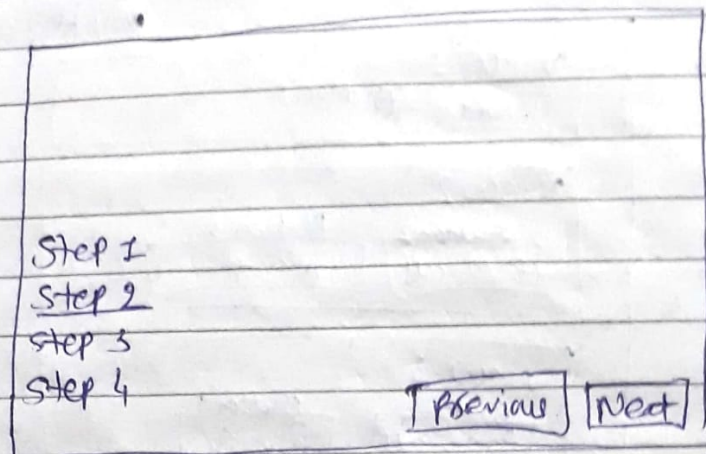

```
    Multiview.ActiveViewIndex += 1 ;
```

```
}
```

// similarly for previous index - = 1 ;

// & for finish button change the label

Database connectivity.

Add new item \rightarrow sql server db.
faculty.mdf
In server explores,

key: id int
name varchar
Department varchar
City varchar

Click on Update \rightarrow update db.
& then add data in table.

\rightarrow Add new web form
add GridView control
add sqlDataSource
 $\triangleright \rightarrow$ click \rightarrow configure data source
select faculty.mdf.

Do you want to save? \Rightarrow FacultyInfo
select query
Test query

\rightarrow GridView $\triangleright \rightarrow$ Choose dataSource \rightarrow 1.
properties: pageSize = 2
DataKeyNames = Id
AutoGenerateEditButton = True

\Rightarrow For configuring a db update & del query
configure data source \rightarrow Advanced
☒ allow INSERT, ...
☒ ...

Refresh schema by GridView \triangleright then run app.

\Rightarrow Auto generate del button = True.

* DetailView Control

- Add \Rightarrow It will display one record at a time
- $\Delta \rightarrow$ choose DataSource $\rightarrow 1$ Enable paging
- \Rightarrow You can't insert record in gridView it is possible by programming
 - AutoGenerate Edit \rightarrow True
 - Delete \rightarrow True
 - Insert \rightarrow True

Q. In GridView \Rightarrow select a record which is displayed in detailview

Add other SqlDataSource \Rightarrow configure it
Select * from '___' where Id = Control
Control ID \Rightarrow GridView1
Advanced ☒ ☒
Test query ☒

\Rightarrow DetailView \Rightarrow select DataSource $\Rightarrow 2$

Masters Page

Page No. :

Date :

Create a web site

Add → new item → master page

In design view

menu bar → Tables → row: 3, column: 1 & create Boundrice.

Without content in ContentPlaceHolder
master page never run.

Add → new item → web form

☒ place code in separate file

☒ select master page

Add

Find control
method of
master page

In content placeholders add label with
name Content from WebPage1.

And then run the page.

No Header & Footer will be editable

⇒ In header add label & TB.

username

In content ph add button click

In buttonclick event add the code

```
TextBox tx = (TextBox)Master.FindControl  
("TextBox1") as TextBox;  
Label3.Text = "Welcome " + tx.Text;
```

Using Get set property &

⇒ Defautt. aspx &

<%@masterType ee="Master" VirtualPath = "~\Masterpage
master" %>

⇒ In Masterpage . master. cs .

```
public string getname
```

```
{
```

```
    get { return TB1.Text; }
```

```
    set { TB1.Text = value; }
```

```
}
```

Defautt. aspx. CS .

In button click

```
Label3.Text = "Welcome" + Master.getname;
```

* File upload.

Add file upload in design

Add button & upload.

In button click event

```
if (FileUpload1.HasFile)
```

```
{
```

```
    R.w. (FileUpload1.PostedFile.ContentType.  
        ToString());
```

```
    FileUpload1.PostedFile.SaveAs(@"E:\IT036\"  
        + FileUpload1.PostedFile.ToString());
```

```
}
```

⇒ Add a dropdownlist → Autopostback = true

class

```
{
```

```
    DriveInfo[] driveInfo;
```

In page load method.

```
{
```

```
    if (!IsPostBack)
```

```
{
```

```
        driveInfo = DriveInfo.GetDrives();
```

```
        DropDownList1.DataSource = driveInfo;
```

```
        DropDownList1.DataBind();
```

```
        foreach (DriveInfo d in driveInfo)
```

```
{
```

```
            R.w. (" " + d.Name.ToString() +
```

```
            "Size id : " + d.TotalSize.ToString() +
```

```

        "<br>");
    }
    DirectoryInfo d1 = new DirectoryInfo("E:\\");
    DirectoryInfo[] dirs = d1.GetDirectories();
    foreach (DirectoryInfo d2 in dirs)
    {
        R.W. (" " + d2.Name.ToString() + "<br>");
    }
}

```

⇒ DropDownList1.SelectedIndexChanged

```

{
    DirectoryInfo d1 = new DirectoryInfo
        (DropDownList1.SelectedItem.Text);
    DirectoryInfo[] dirs = d1.

```

Navigation

Add 4 web pages.
2 site map file → Web. Sitemap

In that,

```
<sitemapNode url = 'Default.aspx'
  title = "Home" description = "Home Page">
<sitemapNode url = "Default2.aspx"
  title = "Second" description = "Second Page">
< third >
</sitemapNode>
```

↑
Home > Second > third.

↪ Add xml file

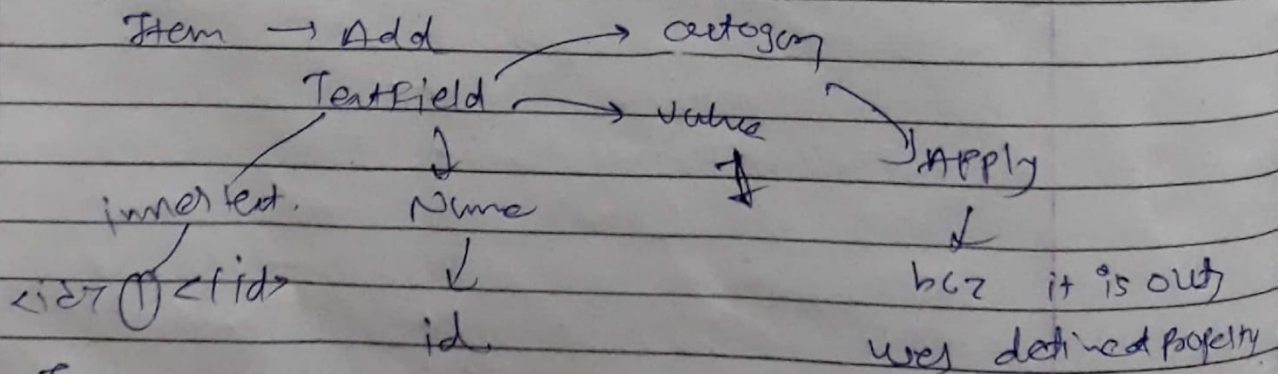

23 Drag & drop xml data source → configure it
from toolbar give xml file to the
source

→ select data source as xml in tree

property: DataBinding,

Hardware → Add

Item → Add

→ Tree properties: show checkboxes

Root Parent Leaf All;

It will show cb in respective names

⇒ Treeview control is a collection of tree node to find that which value user have selected.

do the following in Default.aspx

Show checkboxes → parent, leaf, All.

Add a button.

⇒ In Button-Click event,

```
foreach (TreeNode tn in TreeView1.selectedNodes  
checkedNodes) {
```

```
if (tn.Checked)
```

```
    R.W. ("You have selected : " + tn.ParentText  
        + " and value is : " + tn.TextText  
        + "<br>");
```

Add TB & Button.

In ButtonClick event.

```
TreeNode newNode = new TreeNodenewnode.Text =  
TreeView1.FindNode("Hardname/Rpm/").TBI: Text;  
childNodes.Add(newNode);
```

⇒ Add control → menu.
select with xml DataSource.
And do binding
from properties → Data Binding
Textfield.

In xml file.

< Item

< option

choice = "100-KB"

do this with all
the tags

url = "default.aspx"/>
